

Write a program to implement array operations: insertion and deletion. Array should only store integer values in ascending order.

make separate function for all

use sort() function to sort the values in ascending order if the list given by the user is unsorted.

insert() function will insert a given value into appropriate location using searching operation. No location will be given by the user. Use search() function to search location.

delete() function will delete a given value. No location will be given by the user. Use search() function to search location.

include a function display() to print output array into a text file.

**** Submit .c/.cpp file, input screenshot and output text file**
